

Customer Segmentation Project

Data Analytics Internship Project

Objective

To segment customers based on age, annual income, and spending score using K-Means Clustering.

Abstract

Customer segmentation helps businesses identify groups of customers with similar characteristics. This project demonstrates the use of K-Means clustering to divide customers into meaningful segments.

Tools Used

Python, Pandas, Scikit-Learn, Matplotlib

Sample Dataset

Attributes used: Customer ID, Age, Annual Income, and Spending Score.

Methodology

1. Data Collection
2. Data Cleaning
3. Feature Selection
4. K-Means Clustering
5. Visualization and Analysis

Results

Customers were grouped into clusters such as high-income high-spending, high-income low-spending, and medium-value customers.

Conclusion

K-Means clustering successfully segmented customers and provided useful insights for targeted marketing and business decision-making.
